All Automated Point Cloud Classification

ScanX is built for productivity. The platform aims to make point cloud data analysis easier with the help of automation and the implementation of machine learning algorithms.

With just a few clicks, any of your uploaded data can have complete visualization of point clouds. This includes automated classifications such as land, waterways, buildings, and carbon information. Point cloud clean-ups such as removing noise, dust, and debris can also help ScanX users focus more on analysis; finding solutions to their specific needs.
